

Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in the above-identified application:

Listing of Claims

Claim 1 (Canceled).

Claim 2 (Currently Amended) ~~A gasket assembly according to claim 1, for placement~~
between the periphery of the face of a fuel cell stack and a manifold, said gasket assembly
having one or more of: different compressibilities over predetermined portions of the length of
said gasket assembly; and a resilient shim disposed within preselected sections of said gasket
assembly, and

wherein the face of said fuel cell stack has opposing first and second periphery portions formed by portions of the end faces of the end plates of the fuel cell stack and opposing third and fourth periphery portions formed by end portions of the end faces of the bipolar plates of the fuel cells of the fuel cell stack, said third and fourth periphery portions expanding to a greater degree than said first and second periphery portions due to said bipolar plates expanding to a greater degree than said end plates, and wherein said gasket assembly has said different compressibilities over predetermined portions of said gasket assembly and includes a member having said predetermined portions of said gasket assembly, said member having first and second portions adapted to face said first and second periphery portions of said face of said fuel cell stack and third and fourth portions adapted to face said third and fourth periphery portions of said face of said fuel cell stack, said first and second portions of said member being of lower compressibility than said third and fourth portions of said member.

Claim 3 (Original) A gasket assembly according to claim 2, wherein each of said first, second, third and fourth portions of said member are formed by layers of a fibrous material.

Claim 4 (Original) A gasket assembly according to claim 3, wherein said fibrous material is zirconia felt.

Claim 5 (Original) A gasket assembly according to claim 3, wherein said layers of said first and second portions of said member are filled with a material so as to cause said first and second portions of said member to be of lower compressibility than said third and fourth portions of said member.

Claim 6 (Original) A gasket assembly according to claim 5, wherein said first and second portions of said member are compressible up to approximately 30-60 % of the original thickness of said first and second portions and said third and fourth portions of said member are compressible up to approximately 50-80% of the original thickness of said third and fourth portions.

Claim 7 (Original) A gasket assembly in accordance with claim 6, wherein the original thickness of each of said first and second portions of said member is 0.208-0.308 inches and the original thickness of each of said third and fourth portions of said member is 0.208-0.308 inches.

Claim 8 (Original) A gasket assembly according to claim 5, wherein said material is silica powder.

Claim 9 (Original) A gasket assembly according to claim 2, wherein said gasket assembly has said resilient shim, parts of said resilient shim being embedded in said first and second portions of said member.

Claim 10 (Original) A gasket assembly according to claim 9, wherein said resilient shim includes sections along said resilient shim which provide said resiliency to said resilient shim.

Claim 11 (Original) A gasket assembly according claim 10, wherein each of said sections of said shim extends outward of the plane of said resilient shim.

Claim 12 (Original) A gasket assembly according to claim 11, wherein said resilient shim has a flat body and said sections of said resilient shim are cut from said flat body so that each of said sections of said resilient shim is connected to said flat body along one side of that section.

Claim 13 (Original) A gasket according to claim 12, wherein said sections of said resilient shim are spaced along the length of said flat body and the one side of each of said sections of said resilient shim is on the same side of each of said sections of said resilient shim.

Claim 14 (Original) A gasket assembly according to claim 12, wherein each of said sections of said resilient shim is disposed at an angle θ from said flat body and provide compliance to said resilience shim.

Claim 15 (Original) A gasket assembly in accordance with claim 11, further comprising an outer wrap enclosing said resilient shim.

Claim 16 (Original) A gasket assembly according to claim 15, wherein said outer wrap is closed only on one side of said resilient shim.

Claim 17 (Original) A gasket assembly according to claim 16, wherein said one side of said resilient shim is the side adapted to face inward of said fuel cell stack.

Claim 18 (Original) A gasket assembly according to claim 15, wherein said resilient shim and said outer wrap comprise a metallic material.

Claim 19 (Original) A gasket assembly according to claim 9, wherein the ends of the third and fourth portions of said member are adapted to face said first and second periphery portions

of said face of said stack, and parts of said resilient shim are embedded in said ends of said third and fourth portions of said member.

Claim 20 (Original) A gasket assembly according to claim 19, wherein each of said first, second, third and fourth portions of said member are formed by layers of a fibrous elastic material, and the parts of said resilient shim embedded in said first and second portions of said member are disposed between the layers of fibrous elastic material of said first and second portions and the parts of said shim embedded in said ends of said third and fourth portions of said members are disposed between the layers of fibrous elastic material of said third and fourth portions.

Claim 21 (Original) A gasket assembly according to claim 20, wherein said layers of said first and second portions of said member are filled with a material so as to cause said first and second portions of said member to be of lower compressibility than said third and fourth portions of said member.

Claim 22 (Original) A gasket assembly according to claim 21, wherein said first and second portions of said member are compressible up to approximately 30-60% of the original thickness of said first and second portions and said third and fourth portions of said member are compressible up to approximately 50-80% of the original thickness of said third and fourth portions.

Claim 23 (Original) A gasket assembly in accordance with claim 22, wherein the original thickness of each of said first and second portions of said member is 0.208-0.308 inches and the original thickness of each of said third and fourth portions of said member is 0.208-0.308 inches.

Claim 24 (Original) A gasket assembly according to claim 21, wherein said material is silica powder.

Claim 25 (Original) A gasket assembly according to claim 21, wherein said resilient shim includes sections along said resilient shim which provide said resiliency to said shim.

Claim 26 (Original) A gasket assembly according claim 25, wherein each of said sections of said resilient shim extends outward of the plane of said resilient shim.

Claim 27 (Original) A gasket assembly according to claim 26, wherein said resilient shim has a flat body and said sections of said resilient shim are cut from said flat body so that each of said sections of said resilient shim is connected to said flat body along one side of that section.

Claim 28 (Original) A gasket assembly according to claim 27, wherein said sections of said resilient shim are spaced along the length of said flat body and the one side of each of said sections of said resilient shim is on the same side of each of said sections of said resilient shim.

Claim 29 (Original) A gasket assembly according to claim 28, wherein each of said sections of said resilient shim is disposed at an angle θ relative to said flat body and provides compliance to said resilient shim.

Claim 30 (Original) A gasket assembly according to claim 26, further comprising an outer wrap enclosing said resilient shim.

Claim 31 (Original) A gasket assembly according to claim 30, wherein said wrap is closed only on one side of said resilient shim.

Claim 32 (Original) A gasket assembly according to claim 31, wherein said one side of said resilient shim is the side adapted to face inward of said fuel cell stack.

Claim 33 (Original) A gasket assembly according to claim 30, wherein said resilient shim and said outer wrap comprise a metallic material.

Claim 34-36 (Canceled).

Claim 37 (Currently Amended) A gasket assembly according to claim ~~36~~ 40, wherein said resilient shim has a flat body and said sections of said resilient are cut from said flat body so that each of said sections of said resilient shim is connected to said flat body along one side of that section.

Claim 38 (Original) A gasket assembly according to claim 37, wherein said sections of said resilient shim is spaced along the length of said flat body and the one side of each of said sections of said resilient shim is on the same side of each of said sections of said resilient shim.

Claim 39 (Original) A gasket assembly according to claim 38, wherein each said sections of said resilient shim is disposed at an angle θ relative to said flat body and provide compliance to said resilience shim.

Claim 40 (Currently Amended) A gasket assembly according to ~~claim 36~~, for placement between the periphery of the face of a fuel cell stack and a manifold, said gasket assembly having one or more of: different compressibilities over predetermined portions of the length of said gasket assembly; and a resilient shim disposed within preselected sections of said gasket assembly,

and wherein: said gasket assembly includes a member and said resilient shim is embedded in said member; said resilient shim includes sections along said resilient shim which provide said resiliency to said resilient shim; each of said sections of said resilient shim extends outward of the plane of said resilient shim;

and said gasket assembly further comprising an outer wrap enclosing said resilient shim.

Claim 41 (Original) A gasket assembly according to claim 40, wherein said outer wrap is closed only on one side of said resilient shim.

Claim 42 (Original) A gasket assembly according to claim 41, wherein said one side of said resilient shim is the side adapted to face inward of said fuel cell stack.

Claim 43 (Original) A gasket assembly according to claim 40, wherein said resilient shim and said outer wrap comprise a metallic material.

Claim 44 (Previously Presented) A fuel cell stack assembly comprising:

a fuel cell stack including: end plates at opposite ends of said stack; a plurality of fuel cells stacked one against the other between said end plates; and said fuel cells and said end plates defining at least one face for said fuel cell stack;

a manifold adjacent said one face of said fuel cell stack; and

a gasket assembly for placement between the periphery of said face of a fuel cell stack and said manifold, said gasket assembly having one or more of: different compressibilities over predetermined portions of the length of said gasket assembly; and a resilient shim disposed within preselected sections of said gasket assembly.

Claim 45 (Original) A fuel cell stack assembly according to claim 44, wherein the face of said fuel cell stack has opposing first and second periphery portions formed by portions of the end faces of the end plates of the fuel cell stack and opposing third and fourth periphery portions formed by end portions of the end faces of bipolar plates of the fuel cells of the fuel cell stack, said third and fourth periphery portions expanding to a greater degree than said first and second periphery portions due to said bipolar plates expanding to a greater degree than said end plates, and wherein said gasket assembly has said different compressibilities over predetermined portions of said gasket assembly and includes a member having said predetermined portions of

said gasket assembly, said member having first and second portions adapted to face said first and second periphery portions of said face of said fuel cell stack and third and fourth portions adapted to face said third and fourth periphery portions of said face of said fuel cell stack, said first and second portions of said member being of lower compressibility than said third and fourth portions of said member.

Claim 46 (Original) A fuel cell stack assembly according to claim 45, wherein each of said first, second, third and fourth portions of said member are formed by layers of a fibrous elastic material.

Claim 47 (Original) A fuel cell stack assembly according to claim 46, wherein said fibrous elastic material is zirconia felt.

Claim 48 (Original) A fuel cell stack assembly according to claim 46, wherein said layers of said first and second portions of said member are filled with a material so as to cause said first and second portions of said member to be of lower compressibility than said third and fourth portions of said member.

Claim 49 (Original) A fuel cell stack assembly according to claim 48, wherein said material is silica powder.

Claim 50 (Original) A fuel cell stack assembly according to claim 45, wherein said gasket assembly has said resilient shim, parts of said resilient shim being embedded in said first and second portions of said member.

Claim 51 (Original) A fuel cell stack assembly according to claim 50, wherein said resilient shim includes sections along said resilient shim which provide said resiliency to said resilient shim.

Claim 52 (Original) A fuel cell stack assembly according claim 51, wherein each of said sections of said resilient shim extends outward of the plane of said resilient shim.

Claim 53 (Original) A fuel cell stack assembly in accordance with claim 52, further comprising an outer wrap enclosing said resilient shim.

Claim 54 (Original) A fuel cell stack assembly according to claim 53, wherein said outer wrap is closed only on one side of said resilient shim.

Claim 55 (Original) A fuel cell stack assembly according to claim 54, wherein said one side of said resilient shim is the side adapted to face inward of said fuel cell stack.

Claim 56 (Original) A fuel cell stack assembly according to claim 50, wherein the ends of the third and fourth portions of said member are adapted to face said first and second periphery portions of said face of said stack, and parts of said resilient shim are embedded in said ends of said third and fourth portions of said member.

Claim 57 (Original) A fuel cell stack assembly according to claim 56, wherein each of said first, second, third and fourth portions of said member are formed by layers of a fibrous elastic material, and the parts of said resilient shim embedded in said first and second portions of said member are disposed between the layers of fibrous elastic material of said first and second portions and the parts of said resilient shim embedded in said ends of said third and fourth portions of said members are disposed between the layers of fibrous elastic material of said third and fourth portions.

Claim 58 (Original) A fuel cell stack assembly according to claim 57, wherein said layers of said first and second portions of said member are filled with a material so as to cause said first and second portions of said member to be of lower compressibility than said third and fourth portions of said member.

Claim 59 (Original) A fuel cell stack assembly according to claim 58, wherein said material is silica powder.

Claim 60 (Original) A fuel cell stack assembly according to claim 58, wherein said resilient shim includes sections along said resilient shim which provide said resiliency to said resilient shim.

Claim 61 (Original) A fuel cell stack assembly according claim 58, wherein each of said sections of said resilient shim extends outward of the plane of said resilient shim.

Claim 62 (Original) A fuel cell stack assembly according to claim 61, further comprising an outer wrap enclosing said resilient shim.

Claim 63 (Original) A fuel cell stack assembly according to claim 62, wherein said outer wrap is closed only on one side of said resilient shim.

Claim 64 (Original) A fuel cell stack assembly according to claim 63, wherein said one side of said resilient shim is the side adapted to face inward of said fuel cell stack.

Claim 65 (Original) A fuel cell stack assembly according to claim 62, wherein said resilient shim and said outer wrap comprise a metallic material.

Claim 66 (Original) A fuel cell stack assembly in accordance with claim 44, wherein said gasket assembly includes a member and said resilient shim is embedded in said member.

Claim 67 (Original) A fuel cell stack assembly according to claim 66, wherein said resilient shim includes sections along said resilient shim which provide said resiliency to said resilient shim.

Claim 68 (Original) A fuel cell stack assembly according claim 67, wherein each of said sections of said resilient shim extends outward of the plane of said resilient shim.

Claim 69 (Original) A fuel cell stack assembly according to claim 68, further comprising an outer wrap enclosing said resilient shim.

Claim 70 (Original) A fuel cell stack assembly according to claim 69, wherein said outer wrap is closed only on one side of said resilient shim.

Claim 71 (Original) A fuel cell stack assembly according to claim 70, wherein said one side of said resilient shim is the side adapted to face inward of said fuel cell stack.

Claim 72 (Original) A fuel cell stack assembly according to claim 71, wherein said resilient shim and said outer wrap comprise a metallic material.
